

## “Rockers” give lift to drivers productivity

The “Rocker” range of products manufactured locally by Ehrenberg Engineering is specifically geared to ensure a forklift driver enjoys maximum comfort, safety and flexibility in his working environment.

Rocker bins, designed for the fast and efficient handling of a wide range of materials, are well balanced, whether empty or loaded and the forks slide easily, yet securely into the “shoes” of the bins.

It is their unique tipping ability, however, brought about by the disengagement of the locking mechanism, followed by the tilting of the forkhoist, which will be of the greatest value for fast dumping or unloading. The emptied bin rocks back into its original position by the backward tilt of the forkhoist and is automatically locked. The forklift driver, therefore, does not need to leave his seat, thus saving time and effort.

There are a multitude of applications for the product, ranging from brick-making through packaging to leather, textiles and the pharmaceutical industry.

The versatility of the Rocker bin range has recently been extended with the introduction of the Turbo Rocker bin. By combining the Rocker bin with an airtight lid and a high-performance turbo industrial vacuum cleaner, it has numerous cleaning and pneumatic filling applications. The Rocker barrow is a popular addition to the Rocker bin family and has been designed for manual bulk handling.

The Rocker pallet, specifically designed for loading bricks, bales, or bulky materials, also forms part of the increasing range of products manufactured by the company. This flexible and labour-saving range of products will ensure that Ehrenberg Engineering is capable of satisfying its customers' materials handling needs in the future South Africa.
