

25 years' service to the South African Industry

Ehrenberg Engineering, manufacturers of a range of specialised materials handling equipment, has steadily built up a reputation for supplying the food and beverage industry, mining and general engineering industries over a period of 25 years.

Founded in 1967, the company was originally involved in the import of machinery, but switched to local manufacture some three years later. Today it manufactures and markets a fully comprehensive range of "Rocker" products.

Rocker bins, designed for the fast and efficient handling of a wide range of materials, are well balanced, whether empty or loaded and the forks slide easily, yet securely into the "shoes" of the bins.

It is their unique tipping ability, however, brought about by the disengagement of the locking mechanism, followed by the tilting of the forkhoist, which will be of the greatest value for fast dumping or unloading. The emptied bin rocks back into its original position by the backward tilt of the forkhoist and is automatically locked. The forklift driver, therefore, does not need to leave his seat, thus saving time and effort.

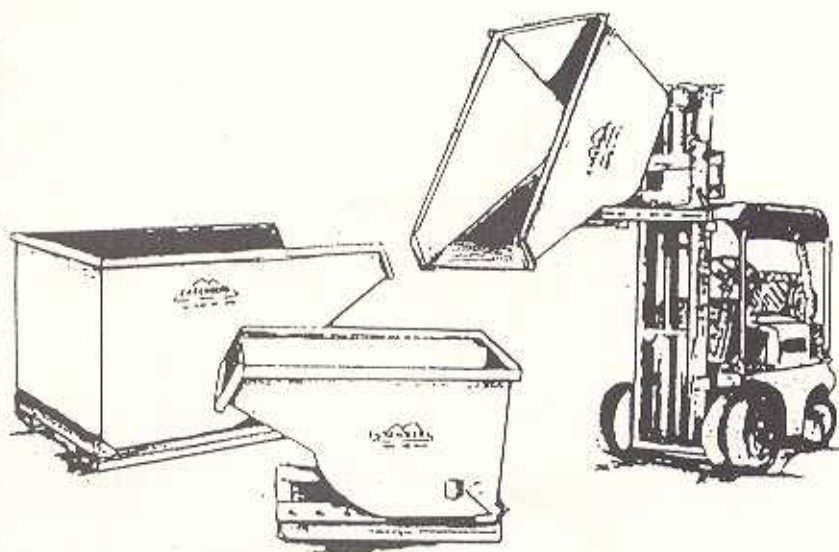

These robust bins are available in various standard sizes and may also be fitted with lids and with wheels and castors for easy manoeuvrability, as well as a multitude of other accessories and attachments for the endless number of applications, which range from handling of steel off-cuts, manufactured components and factory waste to fruit, foodstuffs and liquids. The versatility of the Rocker bin range has recently been extended with the introduction of the Turbo Rocker bin. By combining the Rocker bin with an airtight lid and a high-performance turbo industrial vacuum cleaner, it has numerous cleaning and pneumatic filling applications. The Rocker barrow is a popular addition to the Rocker bin family. This mini-tipping barrow has been designed for manual bulk

handling. The barrow has a capacity of about 9,12³, being about twice that of a standard wheelbarrow. Its perfect balance makes it easy to wheel and a simple foot release tips the barrow without any effort by the operator. The Rocker barrow has an immense variety of applications on building and construction sites, for agricultural purposes, in factories, as well as for

refuse and waste materials. Besides the normal applications, new uses are found daily. The Rocker pallet, specifically designed for loading bricks, bales, or bulky materials, also forms part of the increasing range of products manufactured by the company.
